Fighter Jet Escort

The image above shows two F-22 Tactical Fighter jets escorting a C-17 over Poland in a scene from Bohemia Interactive Simulations' [VBS STE](#), a prototype desktop virtual training environment combining an enhanced VBS simulation engine with VBS Blue rendering, delivering full VBS capability for scenario-based training anywhere on the globe. Collective tactical training and mission rehearsal can be kicked off within seconds, incorporating all VBS features including VBS Chalkboard for tactical planning using military symbology, VBS Radio for realistic radio communications and the thousands of other VBS capabilities that have been developed over the past 15 years, including the full VBS content library.

Bohemia Interactive Simulations (BISim) has been developing its next generation of simulation technologies since 2014. The new technology suite includes a cutting-edge, military-specific game engine, deterministic AI, an efficient geo-special terrain server and component-based development technology. These technologies underpin BISim commercial products such as [VBS Blue IG](#) and have been leveraged to demonstrate the art of the possible for U.S. Army simulation since 2016 for the Army's Synthetic Training Environment Initiative. STE aims to bring together virtual, constructive and gaming training environments into a single unified architecture.

BISim's product suite proposed for the Army's STE initiative will be on display for live demos during I/ITSEC 2018, held in Orlando, Florida, Nov. 26-29 at booth #2235.
